Set1,Q7 Set2,Q6 Set3,Q9	Unpolarised light and linearly polarized light ½ + ½ Diagram & description ½ + ½ For unpolarised light electric vector associated with light, is oscillating randomly in all directions in a plane perpendicular to the direction of propagation of light. In linearly polarised light oscillating electric vector gets aligned along one direction perpendicular to the direction of propagation of light.	 ½ ½	

	[Under the influence of the electric field of the incident wave, the electrons (of the scattering molecules), accelerated parallel to the double arrows, do not radiate energy towards the observer. Hence, the scattered light gets polarized.] 	½ + ½	2
Set1,Q8 Set2,Q7 Set3,Q10	Reason for dispersion 1 Dependence of focal length of the lens on colour 1 The refractive index of the glass of the prism is different for different wavelengths(colours). Hence, different colours get bent along different directions. Using lens maker's formula $\frac{1}{f} = (n_{21} - 1)\left(\frac{1}{R_1} - \frac{1}{R_2}\right), n_{21} = \frac{n_2}{n_1}$ As the refractive index of the medium with respect to air (medium 1) depends on the wavelength or colour of light, focal length of the lens would change with colour.	1 1	2
Set1,Q9 Set2,Q8 Set3,Q6	Calculation of the value of Plank's constant 2 According to Einstein's photoelectric equation $V_o = \frac{h}{e}\nu - \frac{\phi_o}{e}$ In the given graph: Stopping potential V_o = 1.23 V Change in frequency $\Delta\nu = 3 \times 10^{14}$Hz (Alternatively : slope of the line = $\frac{h}{e}$) $\frac{h}{e} = \frac{V_o}{\Delta\nu} = \frac{1.23}{3 \times 10^{14}}$ $\therefore h = \frac{1.23 \times 1.6 \times 10^{-19}}{3 \times 10^{14}}$J-s $= 6.6 \times 10^{-34}$ J-s	½ ½ ½ ½	2
Set1,Q10 Set2,Q9 Set3,Q7	Completion of nuclear reaction (a) 1 Completion of nuclear reaction (b) 1 (a) ${}^{10}_{5}\text{B} + {}^{1}_{0}n \rightarrow {}^{4}_{2}\text{He} + {}^{7}_{3}\text{Li}$ (b) ${}^{94}_{42}\text{MO} + {}^{2}_{1}\text{H} \rightarrow {}^{95}_{43}\text{Te} + {}^{1}_{0}n$ [**Note:** For reaction (a) even if the candidate writes ${}^{7}_{3}$X, award 1 mark] **OR**	1 1	

	Explanation of conversion of mass into energy (vice versa) 1 Example 1 Since proton number and neutron number are conserved, the total rest mass of neutron and protons is the same on either side of the nuclear reaction. But total binding energy of nuclei on the left side need not be the same as that on the right hand side. The difference in binding energy causes a release of energy in the reaction. Example : ${}^{2}_{1}\mathrm{H} + {}^{2}_{1}\mathrm{H} \rightarrow {}^{3}_{2}\mathrm{He} + {}^{1}_{0}n + \text{energy}$ Or $({}^{235}_{92}\mathrm{U} + {}^{1}_{0}n \rightarrow {}^{144}_{56}\mathrm{Ba} + {}^{89}_{36}\mathrm{Kr} + 3\,{}^{1}_{0}n + \text{ energy})$ (Give full credit for any other one correct example.)	1 1	2
Section C			
Set1,Q11 Set2,Q20 Set3,Q17	(i) Figure ½ (ii) Derivation of torque 1 ½ (iii) Identification of two pairs ½ + ½  The force on charge +q is $+q\vec{E}$ and on charge –q is $-q\vec{E}$. These, two parallel forces, acting in the opposite direction, constitute a couple resulting in the torque τ. Magnitude of torque= $qE \times 2a \sin\theta$ $= 2qa\,E \sin\theta$ Therefore, $\vec{\tau} = \vec{p} \times \vec{E}$ where $\vec{p} = 2q\vec{a}$ (ii) Two pairs of perpendicular vectors: (i) $\vec{\tau}$ is perpendicular to $\vec{p}$ (ii) $\vec{\tau}$ is perpendicular to $\vec{E}$	½ ½ ½ ½ ½ ½	3

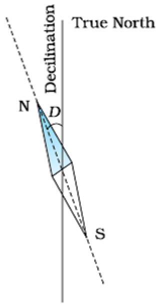
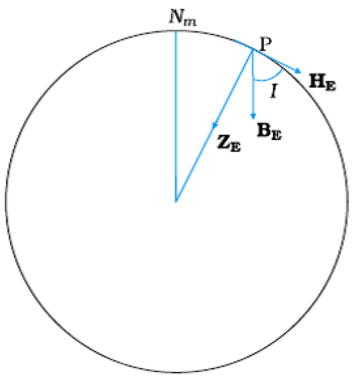
Definition of
(i) Magnetic declination and diagram ½ + ½
(ii) Angle of dip and diagram ½ + ½
Direction of compass needle at the
(i) Poles ½
(ii) Equator ½

Magnetic declination : Angle between the magnetic axis and geographical axis.
Alternatively: Angle between magnetic meridian and geographical meridian.



Angle of dip: It is the angle which the magnetic needle makes with the horizontal in the magnetic meridian.
Alternatively: The angle which the total magnetic field of the earth makes with the surface of the earth.



Direction of compass needle is vertical to the earth's surface at poles and is parallel to the earth's surface at equator.

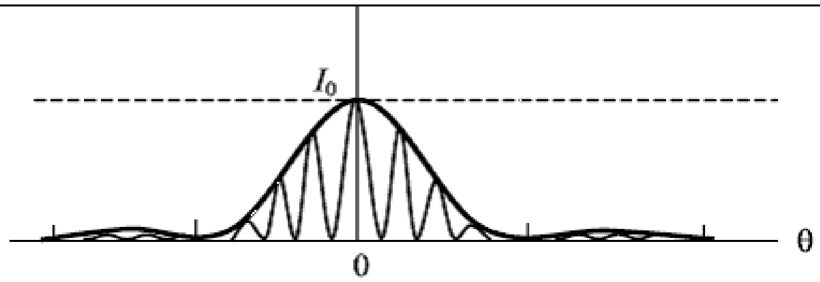
Explanation by drawing a suitable diagram	1
Two basic features distinguishing interference pattern from diffraction pattern	1+1



The diagram, given here, shows several fringes, due to double slit interference, 'contained' in a broad diffraction peak. When the seperation between the slits is large compared to their width, the diffraction pattern becomes very flat and we observe the two slit interference pattern.
[Note: The students may be awarded 1 mark even if they just draw the diagram.]
Two basic features:
(i) The interference pattern has a number of equally spaced bright and dark bands while differaction pattern has a central bright maximum which is twice as wide as the other maxima.
(ii) Interference pattern is the superimposition of two waves slits originating from two narrow sects. The differaction pattern is a superposition of a continuous family of waves originating from each point on a single slit.
(iii) For a single slit of width 'a' the first null of differaction pattern occurs at an angle of $\frac{\lambda}{a}$. At the same angle of λ/a, we get a maxima for two narrow slits seperated by a distance a.
[Any two of the above distinguishing features.]

	Section E		
Set1,Q24 Set2,Q26 Set3,Q26	(a) Derivation of the expression 2 (b) Magnetic field lines due to the coil 1 (c) Magnetic field at the center of the loop 2 (a) 	½	

According to Biot- Savart law,

$$d\vec{B} = \frac{\mu_o}{4\pi}\frac{I(\vec{dl} \times \vec{r})}{r^3}$$ ½

$$dB = \frac{\mu_o}{4\pi}\frac{I\,dl}{(x^2 + R^2)} \qquad \left[\because \left|\vec{dl} \times \vec{r}\right| = r\,dl; \; r = (x^2 + R^2)^{\frac{1}{2}}\right]$$

From figure

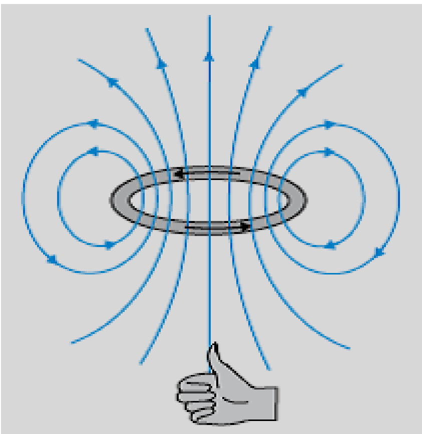
$$\cos\theta = \frac{R}{(x^2 + R^2)^{\frac{1}{2}}}$$

∴ Net contribution along x-direction

$$B = \sum dB\cos\theta = \int dB\cos\theta$$ ½

$$= \int_0^{2\pi R} \frac{\mu_o I dl}{4\pi}\,\frac{R}{(x^2 + R^2)^{\frac{3}{2}}}$$ ½

$$\vec{B} = \frac{\mu_o I R^2}{2\,(R^2 + x^2)^{\frac{3}{2}}}\,\hat{\imath}$$



1

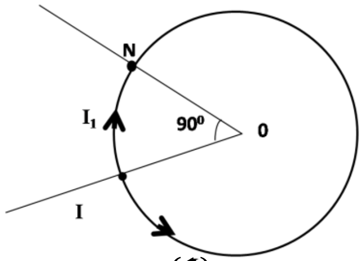
(b) Let current I be divided at point M into two parts I_1 and I_2 ; in bigger and smaller parts of the loop respectively.

Magnetic field of current I_1 at point O ½

$$\vec{B_1} = \frac{\mu_o I_1}{2R} \times \frac{1}{4} \otimes$$

Magnetic field of current I_2 at point O

$$\vec{B_2} = \frac{\mu_o I_2}{2R} \times \frac{3}{4} \odot$$



Net magnetic field $\vec{B} = \vec{B_1} + \vec{B_2}$

$$|\vec{B}| = \frac{\mu_o I_1}{8R} - \frac{\mu_o I_2}{8R} \text{ ------------------ } (1)$$ ½

But $I_1 = 3I_2$ (As resistance of bigger part is three times that of the smaller part of the loop.) ½

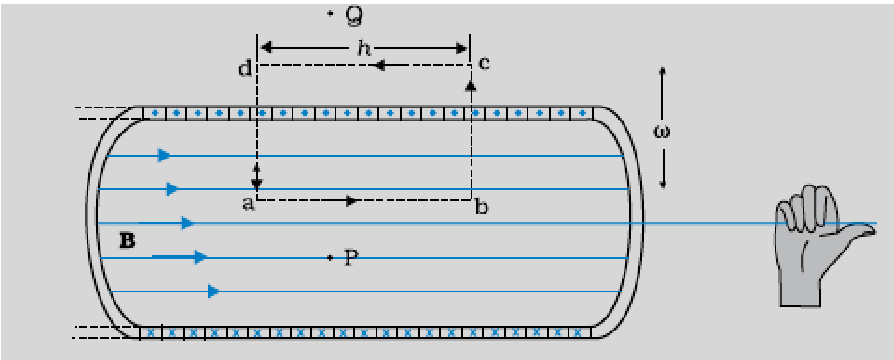
Substituting $I_1 = 3I_2$ in equation (1)

$$\Rightarrow |\vec{B}| = 0$$ ½ 5

OR

(a) Derivation of expression of magnetic field inside solenoid	3
(b) Finding the magnitude and direction of Magnetic field	2

Any surface carrying current can be divided into small line elements, each of length '*dl*'. Considering the tangential components of the magnetic field and finding $\vec{B}.\vec{dl}$, sum of all elements tends to the integral, which can be expressed in the following form. : $\oint \vec{B}.\vec{dl} = \mu_o i$, This form is known as Ampers's circuital law. ½



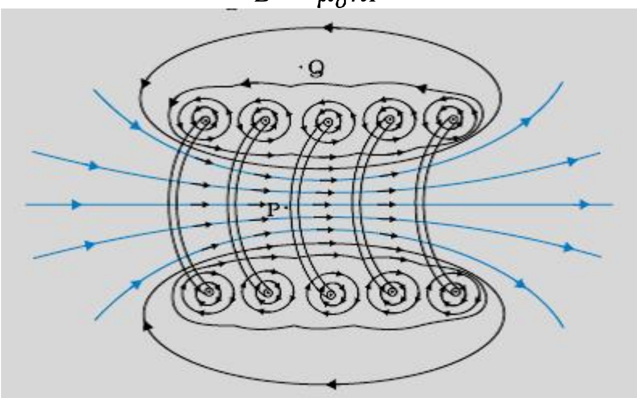
½

Let '*n*' be the number of turns per unit length. Then total number of turns in the length '*h*' is *nh*.
Hence, total enclosed current = *nhI*
Using Ampere's circuital law

$$\oint \vec{B}.\vec{dl} = \mu_o nhI$$ ½

$$Bh = \mu_o nhI$$

$$B = \mu_o nI$$ ½



1

(b)

	As per the given figure, magnetic field must be vertically inwards, to make tension zero, (If a student shows current in opposite direction the magnetic field should be set up vertically upwards. $IlB = mg$ For tension to be zero $B = \frac{mg}{Il} = \frac{60\times10^{-3}\times9.8}{5.0\times0.45}$ T $= 0.26$ T	½ ½ ½ ½	5
Set1,Q25 Set2,Q24 Set3,Q25	(a) Schematic arrangement of Greiger-Marsden Experiment — 1 Reason — 1 Trajectory of α-particles and significance of Impact Parameter — ½ + ½ (b) Estimation of the distance of closest approach — 2 (a)  For most of the α-particles, impact parameter is large, hence they suffer very small repulsion due to nucleus and go right through the foil.  It gives an estimate of the size of nucleus. (b) K.E of the α-particle = potential energy possessed by beam at distance of closest approach. $\frac{1}{2}mv^2 = \frac{1}{4\pi\epsilon_o}.\frac{(2e)(Ze)}{r_0}$	1 1 ½ ½ ½	

	$$7.7 \times 1.6 \times 10^{-13} = \frac{9 \times 10^9 \times 2 \times 2.56 \times 10^{-38} \times 80}{r_o}$$ $$r_o = \frac{9 \times 10^9 \times 2 \times 2.56 \times 10^{-38} \times 80}{7.7 \times 1.6 \times 10^{-13}} \text{ m}$$ $$= 299 \times 10^{-16} \text{ m}$$ $$= 29.9 \times 10^{-15}\text{m} \approx 30 \times 10^{-15}\text{m}$$	½ ½	5
	OR (a) Two important limitations of Rutherford model ½ + ½ Explanation of these limitations in Bohr's model ½ + ½ Calculation of wavelength of the H_α line 1 (b) Derivation of the expression for the radius of the n^{th} orbit. 2		
	(a) (i) Electron moving in a circular orbit around the nucleus would get accelerated, therefore it would spiral into the nucleus, as it looses its energy. (ii) It must emit a continuous spectrum. According to Bohr's model of hydrogen atom, (i) Electron in an atom can revolve in certain stable orbits without the emission of radiant energy. (ii) Energy is released /absorbed only, when an electron jumps from one stable orbit to another stable orbit. This results in a discrete spectrum. $$\frac{1}{\lambda} = R\left(\frac{1}{2^2} - \frac{1}{3^2}\right)$$ $$\frac{1}{\lambda} = 1.1 \times 10^7 \left(\frac{1}{4} - \frac{1}{9}\right)$$ $$\lambda = 656.3 \text{ nm}$$	½ ½ ½ ½ ½ ½	
	(b) We have $\frac{mv^2}{r_n} = \frac{1}{4\pi\varepsilon_o} . \frac{e^2}{{r_n}^2}$ $\Rightarrow r_n = \frac{e^2}{4\pi\varepsilon_o v_n^2}$ ------------------------------------(`1) From Bohr's Postulates: $$mv_n r_n = \frac{nh}{2\pi}$$ $$v_n = \frac{nh}{2\pi m r_n}$$ Substituting for v_n, in equation (1), we get $$r_n = \frac{\varepsilon_o n^2 h^2}{\pi m e^2}$$	½ ½ ½ 1	5
